Tobacco Use Harms At or Around Birth. Smoking and exposure to secondhand smoke among pregnant women causes spontaneous abortions, ectopic pregnancies, still-born births, low-birth-weight babies, and other pregnancy and delivery complications requiring neonatal intensive care. Exposure to nicotine during fetal development, which is a critical time for brain development, also can have lasting negative consequences on brain development. After birth, the effects of tobacco use still linger, increasing the chances of sudden infant death syndrome, respiratory disorders, ear and eye problems, growth and mental retardation, attention deficit disorder, other learning and developmental problems and even long-term behavioral problems, violent tendencies, and criminality. Each year in the United States, more than 400,000 live-born infants are exposed in utero to tobacco from pregnant women smoking. Smoking causes more than 1,000 deaths due to perinatal conditions annually, including 400 from sudden infant death syndrome (SIDS).

Harm to Kids from Smoking by Family Members. Parental or other household smoking after birth also increases the chances that exposed children will suffer from smoke-caused coughs and wheezing, bronchitis, asthma, pneumonia, potentially fatal lower respiratory tract infections, eye and ear problems or injury or death from cigarette-caused fires. Each year, 280 children die from respiratory illness caused by secondhand smoke; and another 300 kids suffer from injuries caused by smoking-caused fires. Secondhand smoke aggravates asthma symptoms in 400,000 to 1 million children, is responsible for between 150,000 and 300,000 new cases of bronchitis and pneumonia and 7,500 to 15,000 hospitalizations among kids (aged 18 months or younger), and causes 790,000 cases of otitis media (an acute or chronic inflammation of the middle ear) that result in office visits each year. Moreover, in 2013, there were more than 8,000 reports of potentially toxic exposure to tobacco and nicotine products among children five years old or younger, caused primarily by young children ingesting cigarettes.

Harm to Youth from Their Own Smoking. Most people focus on the increased risk of heart disease, lung cancer and other cancers from smoking and believe that the harms to kids from their own smoking or other tobacco use do not appear for many years. In fact, many health consequences can occur quite quickly. For example:

- Beyond smoke- or nicotine-stained teeth, smokers are also more likely to suffer from periodontal disease and to have more serious periodontal disease, including tooth loss.
Chronic coughing, increased phlegm, emphysema and bronchitis have been well-established products of smoking for decades. Smokers are also more susceptible to influenza and are more likely to experience severe symptoms when they get the flu. 17

Smoking causes mild airway obstruction, reduced lung function and slowed growth of lung function among adolescents. 18

Teenage smokers suffer from shortness of breath almost three times more often as teens that don’t smoke and produce phlegm more than twice as often as teens who don’t smoke. Not surprisingly, smoking also hurts young people’s physical fitness in terms of both performance and endurance—even among young people trained in competitive running. 19

The resting heart rates of young adult smokers are two to three beats per minute faster than nonsmokers, and studies have shown that early signs of heart disease and stroke can be found in adolescents who smoke. 20

Smoking is also associated with hearing loss, vision problems and increased headaches. 21

While many smokers believe that smoking relieves stress, it is actually a major cause. Smoking only appears to reduce stress because it lessens the irritability and tension caused by the underlying nicotine addiction. 22

High school seniors who are regular smokers and began smoking by the ninth grade are more than twice as likely than their nonsmoking peers to report poorer overall health; are roughly two and a half times more likely to report cough with phlegm or blood, shortness of breath when not exercising and wheezing or gasping; and are three times more likely to have seen a doctor or other health professional for an emotional or psychological complaint. 23

Smoking causes bad breath, makes smokers’ homes and clothes stink, and reduces their sense of smell. 24
